How to add Google Maps to a Shopify Store

Having a map on the website is a simple and easy way to help online stores drive online traffic into physical visits. If you have a Shopify store, you can quickly add Google Maps to your site in three different ways.

Using a Store Locator App

- [ ] Find the app on the Shopify app store (for example, Store Locator by Storemapper)
- [ ] Install it on your Shopify page (through the Shopify app store)
- [ ] Upload your store's location
- [ ] Customize your map
- [ ] Save and publish your store's page

Using an embedded Google Map

- [ ] Create a account via Storemapper and simply embed the code onto your Shopify site

Using the Google Cloud Platform

- [ ] Create a project for Storemapper (you will be prompted when logging in)
- [ ] Agree to terms & conditions
- [ ] Create a billing account (a credit card will need to be added in case you go over Google's free quota)
- [ ] Under API's & Services, select "credentials" and then "create API code"
- [ ] Copy this API code into your Storemapper dashboard under Settings and Map provider
- [ ] Back in the Google cloud platform, Select "Library" from the task bar

- [ ] Search for the three API's - Geocoding, Maps Javascript and Places and enable
